

Polyend news - 24th December 2020,

We are proud to push the **Tracker** further forward with a major functionality **firmware update v1.3.0**. This update is also adding the functionality of onboard games into an otherwise musical mix, allowing users to take a breather from music-making.

For owners of **Polyend Preset** - its firmware is now **open source**, so expect even more flexible functionality to be happening as a result (including the already available Euclidean sequencing implementation).

Our friends from Expressive_E are sharing a free **Carbon MPE** software instrument with all the **Medusa Hybrid Synth** owners.

Find the full press release document [here](#).

All the three events are available in separate posts on our [What's Up Blog](#).

The firmware update among a detailed changelog is available [here](#).
