

Polyend introduces the Play+

Olsztyn, Poland - Nov 20, 2023 Polyend is proud to introduce the Play+, a 16 track sample and synth based groovebox. Play+ retains the original external Play design and unique Play workflow. An upgraded processor enables a host of new features, including stereo sample playback, multitimbral polyphonic synthesis and seamless audio over USB.

4 All New Synthesizer Engines —

Play+ offers more than just sample and MIDI playback; it now includes **integrated synthesizers**. Multiple synth engines have been added, each offering a unique character and including an extensive library of professionally crafted presets. Four all original synth engines will be available at launch with more to come in future updates.

ACD: ACD is a recreation of iconic single-oscillator monophonic analog synths that transport you back to the golden age of electronic music.

FAT: FAT is a powerhouse synth engine that epitomizes the lush, vintage warmth of classic analog synthesizers.

VAP: VAP is a Virtual Analog Polysynth that boasts a dual-oscillator architecture and a versatile modulation matrix.

WTFM: WTFM is a unique 2-operator FM synth engine that utilizes WaveTable-based oscillators driven by a 3x feedback system.

Advanced Multi-Track Audio Over USB Integration and Stereo Expansion

With Play+, we've transitioned from mono to stereo sample playback, allowing for a more nuanced and expansive sonic journey. The Play + includes all-new stereo sample packs to add to the extensive factory sample library of over 5,000 professional samples. With Play+, each track can be sent to your DAW separately, ensuring precision and flexibility in post-production. With up to 14 stereo tracks via USB, you can enhance your tracks with external effects, or add depth during a live set — Play+ is built to complement every stage of your creative process.

Pick and Place - Control the Sequence

Play simplifies music production with its Pick and Place functionality. The 8x16 step grid streamlines the track-building process of picking a trigger and placing it anywhere on the grid. Sequence every parameter on a per-step basis without limitations. You can sequence MIDI tracks, stereo samples, and utilize the latest synth engines simultaneously, offering a comprehensive groovebox experience. Simple Select, Copy, and Paste controls make moving data — steps, tracks, track pages, and variations — around a breeze.

Instant playability

Play+ remains true to the spirit of Play, maintaining the balance between advanced sequencing options and intuitive control to create complex evolving patterns. Enhance your tracks with a number of effects, play modes, and randomization options. For a smooth creative workflow use the new piano roll to build your melody. Play+ also offers beat & melody fills to inspire, enhance, or completely change your music. And keep it musical with scale filtering forcing Play+ to input and output only notes that fit the selected scale.
